Inspection

Subjective Data

| | |
|--------|---------------|
| Age | 8 years old |
| Race | Not specified |
| Gender | Female |

Chief complaint

Sarah Smith presents with a complaint of severe headache, accompanied by nausea and vomiting.

History of Present Illness (location, quality, severity, timing, setting, alleviating/ aggravating factors, associated signs and symptoms)

Sarah's headache started suddenly a day ago, and she rates the severity as 8 out of 10. The headache is located in the frontal area and is accompanied by nausea and vomiting. The headache has not improved with rest, and Sarah is unable to perform her usual activities due to the pain. There are no known factors that alleviate or aggravate the headache, and there are no associated signs or symptoms.

Past Medical History (allergies, current medication, injuries, hospitalizations, surgeries)

Allergies: Sarah has a known allergy to penicillin, which causes her to experience hives and difficulty breathing.

Current medication: Sarah is currently taking albuterol inhaler for asthma, as well as daily oral allergy medication.

Injuries: Sarah had a sprained ankle last year, which required physical therapy.

Hospitalizations: Sarah was hospitalized for pneumonia two years ago and received intravenous antibiotics.

Surgeries: None reported

Family History

None relevant to her current condition

Social History

Sarah lives with her parents and two siblings. There is no history of exposure to infectious diseases or recent travel.

Review of Systems

The patient is experiencing fatigue and loss of appetite, in addition to the chief complaint of fever, cough, and headache.

Objective Data

| | |
|----------------------------|-------------|
| Height (in) | 50 inches |
| Weight (lbs) | 65 pounds |
| BMI | 22.2 |
| Temperature | 99.1°F |
| Blood Pressure (BP) | 110/70 mmHg |

General Appearance

Sarah appears uncomfortable due to her headache, but her general appearance is otherwise normal.

Photo 1

EENT (Eyes, Ears, Nose, Throat)

The eyes, ears, nose, and throat are normal.

Cardiovascular

The heart sounds are normal, with no murmurs or gallops.

Respiratory

The lung sounds are clear.

Integument/ Lymphatic Inspection

The skin is intact with no lesions or rashes.

Laboratory Results

The results of Sarah's blood tests indicate a slightly elevated white blood cell count, which could indicate a mild infection.

Assessment

General Observations

Based on Sarah's symptoms and physical examination, the likely differential diagnosis includes migraines, tension headaches, and viral infections.

Differential Diagnosis

Based on Sarah's symptoms and physical examination, the likely differential diagnosis includes migraines, tension headaches, and viral infections.

Plan

Treatment Plan

Sarah will be treated with ibuprofen for her headache, and her symptoms will be monitored closely. If her symptoms persist or worsen, further diagnostic tests may be necessary. In the meantime, Sarah is advised to rest and avoid strenuous activity.

Follow-up:

The patient will follow up in 2 days to evaluate the effectiveness of the treatment plan and any changes to her symptoms.

Education:

The patient and family will be educated about the possible causes of headaches in children, including stress, lack of sleep, and dehydration. They will also be advised on the importance of rest and hydration to prevent future headaches.
